

LAB 2

Agile Backlog Creation & Sprint Simulation

Jira Screenshots + Detailed Explanation

Project: Student Project Portfolio & Showcase App

Student: Ipsa Mishra

This report contains five generated Jira-style illustrative screenshots and explains the user stories, story points, sprint workflow, burndown chart, and sprint schedule. These are mockups for documentation; they are not captured from a live Jira account.

ILLUSTRATIVE MOCKUP — generated evidence, not a live Jira screenshot

The backlog is the master list of work. It groups related issues under epics and lets the team decide what should be taken into a sprint.

Detailed explanation

Submit project details: As a student, I want to submit project details so that my project can be showcased. This is the basic project-entry capability. A reasonable acceptance check is that required project information can be entered, validated, saved, and displayed.

Upload multimedia artifacts: As a student, I want to upload multimedia artifacts so that others can view my work. Acceptance checks can include allowed-file validation, successful upload, and visibility of the uploaded material.

Edit project submission: As a student, I want to edit my submission so that I can correct mistakes. Acceptance checks can include opening an existing submission, changing fields, saving the update, and seeing the updated data.

Story Points — relative effort estimates

Issue	Summary	Epic	Story Points	Status	Priority
KAN-6	Submit Project Details	Submission	3	To Do	Medium
KAN-7	Upload Multimedia Artifacts	Submission	5	To Do	Medium
KAN-8	Edit Project Submission	Submission	3	To Do	Medium
KAN-9	Grade Projects Using Digital Rubric	Evaluation	5	To Do	High
KAN-10	Vote for Projects	Evaluation	3	To Do	Medium
KAN-11	Prevent Duplicate/Fraudulent Votes	Evaluation	8	To Do	High
KAN-12	View Project Rankings	Results	3	To Do	Medium
KAN-13	View Evaluation Results	Results	3	To Do	Low
KAN-14	View Own Project Results	Results	2	To Do	Low

Story points are relative estimates of effort, complexity, and uncertainty — not hours.

ILLUSTRATIVE MOCKUP — generated evidence, not a live Jira screenshot

Story points provide a relative estimate of effort, complexity, and uncertainty. They are not a direct conversion to hours. In this lab, the specified stories use 2, 3, 5, and 8 points.

Detailed explanation

3-point stories: Submit project details, vote for projects, view project rankings, view evaluation results, and edit project submission are estimated at 3 points in the lab.

5-point stories: Upload multimedia artifacts and grade projects using a digital rubric are estimated at 5 points.

8-point story: Prevent duplicate or fraudulent votes is estimated at 8 points, indicating relatively greater effort or uncertainty in the lab estimate.

2-point story: View own project results is estimated at 2 points.

3. Active Sprint View

The Active Sprint board shows the work selected for a sprint and its current workflow state. The basic columns are To Do, In Progress, and Done.

Detailed explanation

Sprint 1: The lab defines Sprint 1 as project submission and editing. The board therefore demonstrates how the team can move submission-related work through the workflow.

To Do: Work that has not started. The team can pull an item into progress when capacity is available.

In Progress: Work currently being implemented or completed by a team member.

Done: Work that satisfies the team's definition of done. Completion should not mean merely starting or partially implementing the issue.

4. Burndown Chart View

A burndown chart tracks remaining work during a sprint. The horizontal axis represents time and the vertical axis represents remaining story points. The actual line can be compared with an ideal trend.

Detailed explanation

Decreasing line: A decrease generally means estimated remaining work has reduced.

Flat section: A flat section can mean no work was completed or that updates have not yet been reflected.

Ideal vs actual: The two lines help the team discuss progress against the planned pace. The chart should be interpreted together with changes in scope and issue status.

Displayed example: This mockup shows 38 total points, 32 completed, 6 remaining, and 1 day left as example values.

Sprints

Sprint schedule

Sprint	Start	End	Duration	Status	Completed	Issues
Sprint 1	1 Jul 2026	14 Jul 2026	14 days	Completed	8	12
Sprint 2	15 Jul 2026	28 Jul 2026	14 days	Active	4	10
Sprint 3	29 Jul 2026	11 Aug 2026	14 days	Future	0	10
Sprint 4	12 Aug 2026	25 Aug 2026	14 days	Future	0	10

Sprint planning

Each sprint is a time-boxed period containing a selected set of backlog work.

ILLUSTRATIVE MOCKUP — generated evidence, not a live Jira screenshot

The Sprints view gives a schedule-level overview of sprint names, dates, status, and issue counts.

Detailed explanation

Sprint 1: Example completed sprint focused on submission/editing work.

Sprint 2: Example active sprint covering the next group of planned work.

Future sprints: Example future time-boxes used for planning work not yet started.

Why it matters: Sprint dates make the Agile plan time-boxed and help the team organize work into manageable iterations.

6. Lab 2 Sprint Plan and Reflection

Sprint 1: Project submission and editing.

Sprint 2: Project evaluation, voting, and results.

Reflection: Agile backlog creation breaks the project into manageable user stories. Prioritization and story-point estimation help the team plan its work. Sprint boards and burndown charts help track progress and identify unfinished tasks.

Important submission note

The five screenshots in this document are generated illustrative mockups. If your instructor requires proof that the configuration exists in your actual Jira project, replace these mockups with screenshots captured from your live Jira board/backlog/report before submitting.
